(Received 16 March 2000)

Abstract We study the bifurcation problem
\[
\begin{align*}
-\text{div}(a(x)|Du|^{p-2} Du) + h(x)u^{r-1} &= f(\lambda, x, u) \quad \text{in } \Omega \subset \mathbb{R}^N, \\
a(x)|Du|^{p-2} Du \cdot n + b(x)u^{p-1} &= \theta g(x, u) \quad \text{on } \Gamma, \\
u &\geq 0, \quad u \neq 0 \quad \text{in } \Omega,
\end{align*}
\]
where \( \Omega \) is an unbounded domain with smooth non-compact boundary \( \Gamma \), \( n \) denotes the unit outward normal vector on \( \Gamma \), and \( \lambda > 0, \theta \) are real parameters. We assume throughout that \( p < r < p^* = \frac{pN}{N-p} \), \( 1 < p < N \), the functions \( a, b \) and \( h \) are positive while \( f, g \) are subcritical nonlinearities. We show that there exist an open interval \( I \) and \( \lambda^\ast > 0 \) such that the problem has no solution if \( \theta \in I \) and \( \lambda \in (0, \lambda^\ast) \). Furthermore, there exist an open interval \( J \subset I \) and \( \lambda_0 > 0 \) such that, for any \( \theta \in J \), the above problem has at least a solution if \( \lambda \geq \lambda_0 \), but it has no solution provided that \( \lambda \in (0, \lambda_0) \).

Keywords: bifurcation problem; existence and non-existence results; weighted Sobolev spaces; anisotropic media

1. Introduction

Among the great range of processes modelled by nonlinear equations, those leading to bifurcation problems are of particular difficulty and importance. More precisely, many models from chemical engineering, mathematical biology, mechanics and engineering may be written in the form,
\[
u_t = \mathcal{F}(\lambda, u, Du, D^2u, \ldots) \quad \text{in } \Omega \times (0, T),
\]
where \( u = u(x, t) \) is the state of the system under consideration. For instance, if we try to describe the behaviour of a bacteria culture, then the state variable \( u \) might be the number of mass of the bacteria. In many concrete situations problems like (1.1) represent a complicated system of equations involving partial differential equations and other operations, like boundary or initial conditions. Each mathematical model contains (implicitly or explicitly) parameters corresponding to the real world situation being described. For example, the outcome of a bacteria-growing experiment will depend on the size of the
experimental apparatus, the temperature, the composition of the ambient atmosphere, and other parameters. In such a way, a surprising variety of the problems in applied mathematics which exhibit multiple steady-state solutions, even systems with infinitely many degrees of freedom, can be reduced to the form,

\[ u_t = \mathcal{F}(\lambda_1, \lambda_2, \ldots, \lambda_k, u, Du, D^2u, \ldots) \text{ in } \Omega \times (0, T), \]

which involves a large number \( k \) of parameters. However, even for the biologists, it would be difficult to figure out how \( \mathcal{F} \) should depend on all these quantities. In this case, in order to develop a consistent mathematical theory, one tries to fix as many as possible parameters and perhaps to vary one of them so as to see the effect of this. Several parameters in a model, such as Reynold’s number, Lyapunov–Schmidt reduction, etc., can often be lumped into a single one by standard scaling procedures. Thus we obtain the evolution problem (1.1), which depends on a single parameter. The simplest solutions (1.1) can have are equilibrium solutions. These are time-independent solutions of (1.1), i.e. the states which satisfy \( \mathcal{F}(\lambda, u, Du, D^2u, \ldots) = 0 \). Similar problems arise for the case of several state variables. We refer, for example, to the steady-state Brusselator model (see [4]), which was developed to describe morphogenesis and pattern formation in chemical reactions. We assume in this paper that \( \mathcal{F} \) involves the quasilinear differential operator,

\[ \Delta_p u = \text{div}(|Du|^{p-2}Du), \quad 1 < p < \infty. \]

We are concerned in this paper with the study of the following double bifurcation quasilinear problem,

\[
\begin{align*}
- \text{div}(a(x)|Du|^{p-2}Du) + h(x)u^{r-1} & = f(\lambda, x, u) \quad \text{in } \Omega \subset \mathbb{R}^N, \\
a(x)|Du|^{p-2}Du \cdot n + b(x)u^{p-1} & = \theta g(x, u) \quad \text{on } \Gamma, \\
u \geq 0, \quad u \neq 0 & \text{ in } \Omega,
\end{align*}
\]

where \( \Omega \) is an unbounded domain with non-compact, smooth boundary \( \Gamma \), \( \lambda > 0 \), \( \theta \) are real parameters and throughout \( p < r < pN/(N-p) \), \( 1 < p < N \).

The study of non-trivial solutions in the above problem is motivated by the following example. Suppose an inviscid fluid flows irrotationally along a flat-bottomed canal. The flow can be modelled by an equation of the form \( \mathcal{F}(\lambda, u, Du) = 0 \), where \( \mathcal{F}(\lambda, 0, 0) = 0 \). One possible motion is a uniform stream (corresponding to the trivial solution \( u = 0 \)), but it is of course the non-trivial solutions which are of physical interest.

Problems of this type arise in the study of physical phenomena related to equilibrium of anisotropic continuous media which possible are somewhere ‘perfect’ insulators (cf. [7]). For instance, if \( \mathbf{\tau} \) denotes the shear stress and \( D_pu \) is the velocity gradient then these quantities obey a relation of the form \( \mathbf{\tau}(x) = a(x)D_pu(x) \), where \( D_pu = |Du|^{p-2}Du \). The case \( p = 2 \) (respectively \( p < 2, p > 2 \)) corresponds to a Newtonian (respectively pseudoplastic, dilatant) fluid. The resulting equations of motion then involve the quasi-linear operator \( \text{div}(aD_pu) \). We refer in this sense to [2] for the mathematical treatment of the Hele-Shaw flow of ‘power-law fluids’. The concept of Hele-Shaw flow refers to the flow between two closely spaced parallel plates, close in the sense that the gap between
the plates is small compared to the dimension of the plates. Quasilinear problems with a variable coefficient also appear in the mathematical model of the torsional creep (elastic for \(p = 2\), plastic as \(p \to \infty\) [3, 14]). This study is based on the observation that a prismatic material rod subject to a torsional moment, at sufficiently high temperature and for an extended period of time, exhibits a permanent deformation, called \textit{creep}. The corresponding equations are derived under the assumptions that the components of strain and stress are linked by a power law referred to as the \textit{creep-law} (see [13] and [11, 12]).

We also refer to the study of flow through porous media \((p = 3/2\) [19]) or glacial sliding \((p \in (1, \frac{4}{3})\) [15]). We mention the recent papers [5, 9, 10] for the mathematical treatment of bifurcation problems for several classes of quasilinear elliptic equations on unbounded domains and with respect to anisotropic spaces.

The purpose of this paper is to study a quasilinear eigenvalue problem with nonlinear boundary condition in an unbounded domain \(\Omega \subset \mathbb{R}^N\), and we generalize in a larger framework some results from [6]. It is known that for unbounded domains, neither the embedding \(W^{1,p}(\Omega) \hookrightarrow L^q(\Omega)\), nor the trace \(W^{1,p}(\Omega) \rightarrow L^m(\Gamma)\) are compact. So, it is natural to look for more general function spaces, e.g. weighted Sobolev spaces, where compact embeddings can be obtained for suitable weight functions. However, because of the nonlinear boundary condition, it is not only necessary to have compact embeddings of weighted Sobolev spaces, but to also use compactness of the trace operator.

Pflüger [17] studied the trace operators \(W^{1,p}(\Omega; v_0, v_1) \rightarrow L^q(\Gamma; w)\) in weighted Sobolev spaces for sufficiently regular unbounded domains \(\Omega \subset \mathbb{R}^N\) with non-compact boundary. He established certain conditions on the weight functions \(v_0, v_1, w\), which ensure the compactness of this operator.

For a positive measurable function \(w_1\) defined in a domain \(\Omega \subset \mathbb{R}^N\), let \(L^q(\Omega; w_1)\) be the space of all measurable functions \(u\) such that

\[
\|u\|_{q,\Omega,w_1} = \left( \int_{\Omega} |u(x)|^q w_1(x) \, dx \right)^{1/q}
\]

is finite. If \(\Gamma\) is a submanifold in \(\mathbb{R}^N\), we denote by \(L^m(\Gamma; w_2)\) the space of all measurable functions \(u\) such that \(\|u\|_{m,\Gamma,w_2}\) is finite. The weighted Sobolev space \(W^{1,p}(\Omega; v_0, v_1)\) is defined as the set of all functions \(u \in L^p(\Omega; v_0)\) such that all the derivatives \(u_{x_i}\) (\(1 \leq i \leq N\)) belong to \(L^p(\Omega; v_1)\). The corresponding norm is given by

\[
\|u\|_{1,p,\Omega,v_0,v_1} = \left( \int_{\Omega} |u(x)|^p v_0(x) \, dx + \int_{\Omega} |Du(x)|^p v_1(x) \, dx \right)^{1/p}.
\]

Denote by \(A_p\) the Muckenhoupt class which is the set of all positive measurable functions \(v\) in \(\mathbb{R}^N\) satisfying

\[
\frac{1}{|Q|} \left( \int_Q v \, dx \right)^{1/p} \left( \int_Q v^{-1/(p-1)} \, dx \right)^{(p-1)/p} \leq C \quad \text{if } 1 < p < \infty,
\]

\[
\frac{1}{|Q|} \int_Q v \, dx \leq C \text{ ess inf } v(x) \quad \text{if } p = 1,
\]

...
for all cubes $Q$ in $\mathbb{R}^N$. For example, the function $v(x) = (1 + |x|)^\beta$ belongs to $A_p$ if $\beta \in (-N,N(p-1))$ (see [20]).

We always assume that the continuous weight functions $v_0, v_1, w_0, w_1, w_2$ belong to $A_p$. Furthermore, the unbounded domain $\Omega \subseteq \mathbb{R}^N$ and the weight functions are chosen such that we can apply [17, Theorem 2] and [17, Corollary 6] to guarantee that the trace $W^{1,p}(\Omega; v_0, v_1) \to L^p(\Gamma; w_0)$ is continuous and the embedding $W^{1,p}(\Omega; v_2, v_1) \to L^q(\Omega; w_1)$ for some $p < q < pN/(N-p)$, respectively the trace $W^{1,p}(\Omega; v_0, v_1) \to L^m(\Gamma; w_2)$ for some $p < m < p(N-1)/(N-p)$ are compact.

**Remark 1.1.** To give an example of the domain $\Omega \subseteq \mathbb{R}^N$ and of the weight functions $v_0, v_1, w_0, w_1$ and $w_2$ that satisfy the above assumptions, consider $\Omega$ as an infinite cylinder $\omega \times \mathbb{R}$ where $\omega \subset \mathbb{R}^{N-1}$ is smooth, bounded and

$$v_0(x) = \frac{1}{(1 + |x|)^p}, \quad v_1(x) = 1, \quad w_0(x) = (1 + |x|)^{\alpha_0}, \quad w_1(x) = (1 + |x|)^{\alpha_1}, \quad w_2(x) = (1 + |x|)^{\alpha_2}, \quad x \in \mathbb{R}^N.$$

To obtain continuity of the trace operator $W^{1,p}(\Omega; v_0, v_1) \to L^p(\Gamma; w_0)$ and compactness of the embedding $W^{1,p}(\Omega; v_0, v_1) \to L^q(\Omega; w_1)$ respectively of the trace operator $W^{1,p}(\Omega; v_0, v_1) \to L^m(\Gamma; w_2)$ we have to choose

$$-N < \alpha_0 \leq 1 - p, \quad -N < \alpha_1 < q \frac{N-p}{p} - N \quad \text{and} \quad -N < \alpha_2 < m \frac{N-p}{p} - N + 1.$$

Denote by $C_0^\infty(\Omega)$ the space of $C_0^\infty(\mathbb{R}^N)$-functions restricted to $\Omega$. We define the weighted Sobolev space $E$ as the completion of $C_0^\infty(\Omega)$ in the norm $\| \cdot \|_E$, where we shall use the abbreviation $\| \cdot \|_E = \| \cdot \|_{1,p,\Omega,v_0,v_1}$.

**Remark 1.2.** The definition of $E$ and the choice of our weight functions ensure the continuity of the trace $E \to L^p(\Gamma; w_0)$ and the compactness of the embedding $E \to L^q(\Omega; w_1)$ respectively of the trace operator $E \to L^m(\Gamma; w_2)$.

2. **Main results**

Suppose throughout this paper that the following hypotheses are fulfilled.

**(H_1)** $v_0 \in C^1(\mathbb{R}^N)$ and there exists a constant $0 < \sigma < N$ such that

$$|x| \cdot |Dv_0(x)| \leq \sigma v_0(x) \quad \forall x \in \Omega;$$

**(H_2)** $a$ is a positive measurable function, locally bounded in $\Omega$ and there exist positive constants $a_0$, $a_1$ such that

$$a_0(|x|^p v_0(x) + v_1(x)) \leq a(x) \leq a_1 v_1(x) \quad \text{a.e.} \ x \in \Omega;$$

**(H_3)** $b$ is a positive continuous function on $\mathbb{R}^N$ and there exist positive constants $b_0$ and $b_1$ such that

$$b_0|x|^\sigma v_0(x) \leq b(x) \leq b_1 w_0(x) \quad \text{a.e.} \ x \in \Gamma.$$
Let \( f(\lambda, x, s) : (0, \infty) \times \Omega \times \mathbb{R} \to \mathbb{R} \) be non-decreasing in \( \lambda \), measurable in \( x \), derivable in \( s \) satisfying

\((H_4)\) \( f(\cdot, \cdot, 0) = 0, f(\lambda, x, s) + f(\lambda, x, -s) \geq 0 \ \forall \lambda > 0 \), a.e. \( x \in \Omega, \forall s \in \mathbb{R} \);

\((H_5)\) \( |f_s(\lambda, x, s)| \leq \lambda \varphi(x)|s|^q - 2 \) for some \( p < q < r \), a.e. \( x \in \Omega, \forall s \in \mathbb{R} \), where \( \varphi \) is a non-negative, measurable function such that

\[ 0 \leq \varphi(x) \leq c_f w_1(x) \quad \text{a.e. } x \in \Omega; \]

\((H_6)\) \( \lim_{s \to 0} \frac{f(\lambda, x, s)}{\lambda w_1(x)|s|^{q-2}} = 1 \) uniformly in \( x \) and in \( \lambda \);

\((H_7)\) \( |f(\lambda_1, x, s) - f(\lambda_2, x, s)| \leq |\lambda_1 - \lambda_2| \psi(x)|s|^{q-1}, \forall \lambda_1, \lambda_2 > 0 \), a.e. \( x \in \Omega, \forall s \in \mathbb{R} \), where \( \psi \) is a non-negative, measurable function such that

\[ 0 \leq \psi(x) \leq C_f w_1(x) \quad \text{a.e. } x \in \Omega. \]

Assume \( g : \Gamma \times \mathbb{R} \to \mathbb{R} \) is a Carathéodory function that satisfies the following conditions.

\((H_8)\) \( g(\cdot, 0) = 0, g(x, s) + g(x, -s) \geq 0 \) a.e. \( x \in \Gamma, \forall s \in \mathbb{R} \);

\((H_9)\) \( |g(x, s)| \leq g_0(x) + g_1(x)|s|^{m-1} \), for some \( p < m < p(N - 1)/(N - p) \), a.e. \( x \in \Omega, \forall s \in \mathbb{R} \), where \( g_0, g_1 \) are non-negative, measurable functions such that

\[ 0 \leq g_0(x), \quad g_1(x) \leq C_g w_2(x) \quad \text{a.e. } x \in \Gamma, \quad g_0 \in L^{m/(m-1)}(\Gamma; w_2^{1/(1-m)}). \]

The following integrability condition of the ratio \( w_I^r/h^q \) is inspired by assumption (1.4) in [1].

\((H_{10})\) \( h : \Omega \to \mathbb{R} \) is a positive and continuous function satisfying

\[ \int_{\Omega} \left( \frac{w_I^r}{h^q} \right)^{1/(r-q)} \, dx < \infty. \]

Remark 2.1. If \( 0 < q \leq a \in L^\infty(\Omega) \) and \( b \in C(\mathbb{R}^N) \) is a positive function such that

\[ \frac{c_1}{(1 + |x|)^{p-1}} \leq b(x) \leq \frac{c_2}{(1 + |x|)^{p-1}} \]

for some constants \( 0 < c_1 \leq c_2 \),

then hypotheses \((H_1)-(H_3)\) are fulfilled if we take weight functions as in Remark 1.1 with \( \alpha_0 = 1 - p \).

Consider the Banach space \( X = E \cap L^r(\Omega; h) \) endowed with the norm,

\[ \|u\|_X^p := \|u\|_{E}^p + \left( \int_{\Omega} |u(x)|^r h(x) \, dx \right)^{p/r}. \]
Obviously, the following embeddings

\[ X \overset{j}{\hookrightarrow} E \quad \text{and} \quad X \overset{j}{\hookrightarrow} L^r(\Omega; h) \]

are continuous. \hfill (2.1)

The energy functional corresponding to \((P_{\lambda,\theta})\) is given by \(\Phi_{\lambda,\theta} : X \rightarrow \mathbb{R}\),

\[
\Phi_{\lambda,\theta}(u) = \frac{1}{p} \int_{\Omega} a(x)|Du|^p \, dx + \frac{1}{p} \int_{\Gamma} b(x)|u|^p \, d\Gamma + \frac{1}{r} \int_{\Omega} h(x)|u|^r \, dx
- \int_{\Omega} F(\lambda, x, u) \, dx - \theta \int_{\Gamma} G(x, u) \, d\Gamma,
\]

where \(F\) and \(G\) denote the primitive functions of \(f\) and \(g\) with respect to the last variable, i.e.

\[
F(\lambda, x, u) = \int_0^u f(\lambda, x, s) \, ds, \quad G(x, u) = \int_0^u g(x, s) \, ds.
\]

Solutions to problem \((P_{\lambda,\theta})\) will be found as non-negative and non-trivial critical points of \(\Phi_{\lambda,\theta}\). Therefore, a function \(u \in X\) is a solution of the problem \((P_{\lambda,\theta})\) provided that \(u \geq 0\), \(u \not\equiv 0\) in \(\Omega\) and for any \(v \in X\),

\[
\int_{\Omega} a(x)|Du|^{p-2} Du \cdot Dv \, dx + \int_{\Gamma} b(x)|u|^{p-2} uv \, d\Gamma
+ \int_{\Omega} h(x)|u|^{r-2} uv \, dx - \theta \int_{\Gamma} g(x, u) v \, d\Gamma = \int_{\Omega} f(\lambda, x, u)v \, dx.
\]

Set

\[
N_g := \left\{ u \in X : \int_{\Gamma} g(x, u)u \, d\Gamma < 0 \right\}, \quad P_g := \left\{ u \in X : \int_{\Gamma} g(x, u)u \, d\Gamma > 0 \right\},
\]

\[
\theta_* := \sup_{u \in N_g} \frac{\|u\|^p_b}{\int_{\Gamma} g(x, u)u \, d\Gamma}, \quad \theta^* := \inf_{u \in P_g} \frac{\|u\|^p_b}{\int_{\Gamma} g(x, u)u \, d\Gamma},
\]

where \(\|\cdot\|_b\) is defined on \(E\) as follows:

\[
\|u\|_b := \left( \int_{\Omega} a(x)|Du|^p \, dx + \int_{\Gamma} b(x)|u|^p \, d\Gamma \right)^{1/p}. \hfill (2.2)
\]

We introduce the convention that if \(N_g = \emptyset\) then \(\theta_* = -\infty\) and \(\theta^* = +\infty\), provided \(P_g = \emptyset\). Define

\[
N_G := \left\{ u \in X : \int_{\Gamma} G(x, u) \, d\Gamma < 0 \right\}, \quad P_G := \left\{ u \in X : \int_{\Gamma} G(x, u) \, d\Gamma > 0 \right\},
\]

\[
\theta_- := \sup_{u \in N_G} \frac{\|u\|^p_b}{p \int_{\Gamma} G(x, u) \, d\Gamma}, \quad \theta^+ := \inf_{u \in P_G} \frac{\|u\|^p_b}{p \int_{\Gamma} G(x, u) \, d\Gamma}.
\]

If \(N_G = \emptyset\) (respectively, \(P_G = \emptyset\)) then we set \(\theta_- = -\infty\) (respectively, \(\theta^+ = +\infty\)).

Our main results are the following.
We observe that \( \theta \) is well defined on \( X \).

**Lemma 3.1.** There exist positive constants \( C_1 \) and \( C_2 \) such that for every \( u \in E \)

\[
\int_{\Omega} |u|^p v_0(x) \, dx \leq C_1 \int_{\Omega} |Du|^p v_1(x) \, dx + C_2 \int_{\Gamma} |n \cdot x||u|^p v_0(x) \, d\Gamma.
\]

**Proof.** Using the divergence theorem we obtain, for any \( u \in C_0^\infty(\Omega) \),

\[
\int_{\Omega} x \cdot D(|u|^p v_0(x)) \, dx = \int_{\Gamma} (n \cdot x)|u|^p v_0(x) \, d\Gamma - N \int_{\Omega} |u|^p v_0(x) \, dx.
\]

This implies

\[
N \int_{\Omega} |u|^p v_0(x) \, dx \leq \int_{\Gamma} |n \cdot x||u|^p v_0(x) \, d\Gamma
\]

\[
+ \int_{\Omega} |u|^p |x||Du v_0(x)| \, dx + p \int_{\Omega} |x||u|^{p-1}|Du v_0(x)| \, dx.
\]  

(3.1)

Using Hölder’s and Young’s inequality, we get the estimate

\[
p \int_{\Omega} |x||u|^{p-1}|Du v_0(x)| \, dx \leq p \left( \int_{\Omega} |u|^p v_0(x) \, dx \right)^{(p-1)/p} \left( \int_{\Omega} |Du|^p |x|^p v_0(x) \, dx \right)^{1/p}
\]

\[
\leq \varepsilon(p-1) \int_{\Omega} |u|^p v_0(x) \, dx + \varepsilon^{1-p} \int_{\Omega} |Du|^p |x|^p v_0 \, dx,
\]  

(3.2)

where \( \varepsilon > 0 \) is an arbitrary real number. From (3.1), (3.2) and \( (H_1) \) it follows that

\[
(N - \varepsilon(p - 1) - \sigma) \int_{\Omega} |u|^p v_0(x) \, dx \leq \varepsilon^{1-p} \int_{\Omega} |Du|^p |x|^p v_0(x) \, dx + \int_{\Gamma} |n \cdot x||u|^p v_0(x) \, d\Gamma.
\]

Using \( (H_2) \) and choosing \( \varepsilon \) small enough we find

\[
\int_{\Omega} |u|^p v_0(x) \, dx \leq C_1 \int_{\Omega} |Du|^p v_1(x) \, dx + C_2 \int_{\Gamma} |n \cdot x||u|^p v_0(x) \, d\Gamma,
\]

\( \forall u \in C_0^\infty(\Omega) \).

The conclusion of our lemma follows now by standard density arguments. \( \square \)
Lemma 3.2. The quantity \( \| \cdot \|_{b} \) defined by (2.2) represents an equivalent norm on \( E \).

**Proof.** The inequality \( \| u \|_{E}^{p} \leq c \| u \|_{b}^{p} \) follows directly from Lemma 3.1 by using the left hand side inequalities which appear in hypotheses \((H_2)\) and \((H_3)\).

By Remark 1.2 we know that the trace \( E \rightarrow L^{p}(\Gamma; w_{0}) \) is continuous. Therefore, we have that there exists \( C > 0 \) such that

\[
\int_{\Gamma} |u|^{p} w_{0}(x) \, d\Gamma \leq C \| u \|_{E}^{p} \quad \forall u \in E.
\]  

(3.3)

Using the inequalities remained in \((H_2)\), \((H_3)\) and by (3.3) it follows that

\[
\| u \|_{b}^{p} \leq a_{1} \int_{\Omega} |Du|^{p} v_{1}(x) \, dx + b_{1} \int_{\Gamma} |u|^{p} w_{0}(x) \, d\Gamma \leq c' \| u \|_{E}^{p}.
\]

Hence the desired equivalence is proved. \( \square \)

For \( \lambda > 0 \) fixed, let \( f_{\lambda} \) be the function defined by

\[
f_{\lambda}(x, s) = f(\lambda, x, s) \quad \forall x \in \Omega, \forall s \in \mathbb{R}.
\]

Set \( F_{\lambda}(x, u) = \int_{0}^{u} f_{\lambda}(x, s) \, ds \). Denote by \( N_{f_{\lambda}}, N_{F_{\lambda}}, N_{g}, N_{G} \) the corresponding Nemyskii operators.

Lemma 3.3. The operators,

\[
N_{f_{\lambda}} : L^{q}(\Omega; w_{1}) \rightarrow L^{q/(q-1)}(\Omega; w_{1}^{1/(1-q)}), \quad N_{F_{\lambda}} : L^{q}(\Omega; w_{1}) \rightarrow L^{1}(\Omega),
\]

\[
N_{g} : L^{m}(\Gamma; w_{2}) \rightarrow L^{m/(m-1)}(\Gamma; w_{2}^{1/(1-m)}), \quad N_{G} : L^{m}(\Gamma; w_{2}) \rightarrow L^{1}(\Gamma),
\]

are bounded and continuous.

**Proof.** From hypothesis \((H_5)\) we deduce that

\[
\begin{align*}
|f_{\lambda}(x, u)| & \leq \frac{\lambda}{q-1} \varphi(x)|u|^{q-1} \leq \tilde{C}_{f} \lambda |u|^{q-1} w_{1}(x) \quad \text{a.e. } x \in \Omega, \forall u \in \mathbb{R}, \quad \text{where } \tilde{C}_{f} = c_{f}/(q-1), \\
|F_{\lambda}(x, u)| & \leq \frac{\lambda}{q(q-1)} \varphi(x)|u|^{q} \leq \frac{\tilde{C}_{f}}{q} \lambda |u|^{q} w_{1}(x) \quad \text{a.e. } x \in \Omega, \forall u \in \mathbb{R}, \quad \text{denote by } \tilde{C}_{g} \lambda.
\end{align*}
\]

(3.4)

where \( \tilde{C}_{f} \) denotes \( c_{f}/(q-1) \).

For \( u \in L^{q}(\Omega; w_{1}) \) we get (setting \( q' = q/(q-1) \))

\[
\int_{\Omega} |N_{f_{\lambda}}(u)|^{q'} w_{1}^{1/(1-q)} \, dx \leq (\tilde{C}_{f} \lambda)^{q'} \int_{\Omega} |u|^{q} w_{1}(x) \, dx.
\]

Therefore, \( N_{f_{\lambda}} \) is bounded. Similarly, the boundedness of \( N_{F_{\lambda}} \) follows from the estimate

\[
\int_{\Omega} |N_{F_{\lambda}}(u)| \, dx \leq \frac{\tilde{C}_{f}}{q} \lambda \int_{\Omega} |u|^{q} w_{1}(x) \, dx.
\]
Let \( m' = m/(m - 1) \) and \( u \in L^m(\Gamma; w_2) \). Then, by \((H_9)\)
\[
\int_\Gamma |N_g(u)|^{m'}w_2^{1/(1-m)} \, d\Gamma \leq 2^{m'-1}\left( \int_\Gamma g_0^{m'}w_2^{1/(1-m)} \, d\Gamma + \int_\Gamma g_1^{m'}|u|^m w_2^{1/(1-m)} \, d\Gamma \right) \\
\leq 2^{m'-1}\left( C + C_g^{m'}\int_\Gamma |u|^m w_2(x) \, d\Gamma \right),
\]
which shows that \( N_g \) is bounded. In a similar way, by \((H_9)\) and Hölder’s inequality we obtain
\[
\int_\Gamma |N_G(u)| \, d\Gamma \\
\leq \int_\Gamma g_0|u| \, d\Gamma + \frac{1}{m} \int_\Gamma g_1|u|^m \, d\Gamma \\
\leq \left( \int_\Gamma g_0^{m'}w_2^{1/(1-m)} \, d\Gamma \right)^{1/m'} \cdot \left( \int_\Gamma |u|^m w_2(x) \, d\Gamma \right)^{1/m} + \frac{C_g}{m} \int_\Gamma |u|^m w_2(x) \, d\Gamma,
\]
and the boundedness of \( N_G \) follows.

From the usual properties of Nemytskii operators we deduce the continuity of \( N_{f_\lambda}, N_{F_\lambda}, N_g \) and \( N_G \) (see [21]).

In view of Lemmas 3.2 and 3.3, \( \Phi_{\lambda,\theta} \) is well defined on \( X \).

**Lemma 3.4.** The functional \( \Phi_{\lambda,\theta} \) is Fréchet-differentiable on \( X \).

**Proof.** We use the notation,
\[
I(u) = \frac{1}{p} \|u\|_p^p, \quad J(u) = \frac{1}{r} \|u\|_r^r, \quad K_G(u) = \int_\Gamma G(x,u) \, d\Gamma, \quad K_{F_\lambda}(u) = \int_\Omega F_\lambda(x,u) \, dx
\]
Then the Gâteaux derivative of \( \Phi_{\lambda,\theta} \) is given by
\[
\langle \Phi'_{\lambda,\theta}(u), v \rangle = \langle I'(u), v \rangle + \langle J'(u), v \rangle - \langle K'_{F_\lambda}(u), v \rangle - \theta \langle K'_G(u), v \rangle,
\]
where
\[
\langle I'(u), v \rangle = \int_\Omega a(x)|Du|^{p-2}Du \cdot Dv \, dx + \int_\Gamma b(x)|u|^{p-2}uv \, d\Gamma, \\
\langle J'(u), v \rangle = \int_\Omega h(x)|u|^{r-2}uv \, dx, \\
\langle K'_{F_\lambda}(u), v \rangle = \int_\Omega f_\lambda(x,u)v \, dx, \\
\langle K'_G(u), v \rangle = \int_\Gamma g(x,u)v \, d\Gamma.
\]
We need only to show the continuity of \( \Phi'_{\lambda,\theta} \) and the assertion is proved.
Clearly, $I' : E \to E'$ and $J' : L'(\Omega; h) \to (L'(\Omega; h))'$ are continuous. By using (2.1) we see immediately that $I' : X \to X'$ and $J' : X \to X'$ are continuous.

The operator $K_G'$ is a composition of operators

$$X \overset{i}{\to} E \overset{N}{\to} L^m(\Gamma; w_2) \overset{N_x}{\to} L^{m/(m-1)}(\Gamma; w_2^{1/(1-m)}) \overset{k}{\to} E' \overset{i'}{\to} X',$$

where $(k(u), v) = \int_{\Gamma} uv \, d\Gamma$. Obviously, $k$ is a linear operator. By Hölder’s inequality and Remark 1.2,

$$\int_{\Gamma} |uv| \, d\Gamma \leq \left( \int_{\Gamma} |u|^{m'} w_2^{1/(1-m)} \, d\Gamma \right)^{1/m'} \cdot \left( \int_{\Gamma} |v|^m w_2 \, d\Gamma \right)^{1/m},$$

which shows that $k$ is continuous. As a composition of continuous operators, $K_G'$ is continuous, too. Moreover, it is compact since the trace operator $\gamma$ is compact. In a similar way we obtain that $K_{F_\lambda}$ is continuous such that the Fréchet-differentiability of $\Phi_{\lambda, \theta}$ follows. 

\[ \square \]

4. Proof of Theorem 2.2

Assume $\theta < \theta < \theta^*$ and let $\lambda > 0$ be chosen such that problem $(P_{\lambda, \theta})$ possesses at least a solution. We claim that there exists $\lambda^* > 0$ such that $\lambda \geq \lambda^*$. Suppose that $u$ is a solution of problem $(P_{\lambda, \theta})$. Then, using (3.4) we find

$$\|u\|_b^p - \theta \int_{\Gamma} g(x, u)u \, d\Gamma + \int_{\Omega} h(x)|u|^r \, dx = \int_{\Omega} f(\lambda, x, u)u \, dx \leq \lambda \tilde{C}_f \int_{\Omega} |u|^q w_1(x) \, dx. \quad (4.1)$$

Now, Young’s inequality implies the following estimate:

$$\lambda \tilde{C}_f \int_{\Omega} |u|^q w_1(x) \, dx = \int_{\Omega} \frac{\lambda \tilde{C}_f w_1}{h^{q/r}} \cdot h^{q/r} |u|^q \, dx \leq \frac{q - r}{r} \left( \tilde{C}_f \lambda \right)^{r/(r-q)} \int_{\Omega} \left( \frac{w_1}{h^q} \right)^{1/(r-q)} \, dx + \frac{q - r}{r} \int_{\Omega} h |u|^r \, dx.$$

This inequality combined with (4.1) gives

$$\|u\|_b^p - \theta \int_{\Gamma} g(x, u)u \, d\Gamma \leq \frac{r - q}{r} \left( \tilde{C}_f \lambda \right)^{r/(r-q)} \int_{\Omega} \left( \frac{w_1}{h^q} \right)^{1/(r-q)} \, dx + \frac{q - r}{r} \int_{\Omega} h |u|^r \, dx \leq \frac{r - q}{r} \left( \tilde{C}_f \lambda \right)^{r/(r-q)} \int_{\Omega} \left( \frac{w_1}{h^q} \right)^{1/(r-q)} \, dx. \quad (4.2)$$

On the one hand, $\theta < \theta^*$ implies the existence of a constant $C_1 \in (0, 1)$ such that

$$\theta \leq (1 - C_1) \theta^* \leq (1 - C_1) \frac{\|u\|_b^p}{\int_{\Gamma} g(x, u)u \, d\Gamma} \quad \text{for all } u \in P_g,$$
which yields
\[ \|u\|^p_b - \theta \int g(x, u) u \, d\Gamma \geq C_1 \|u\|^p_b \quad \text{for all } u \in P_g. \] (4.3)

On the other hand, \( \theta_* < \theta \) shows that there exists \( C_2 \in (0, 1) \) such that
\[ \|u\|^p_b - \theta \int g(x, u) u \, d\Gamma \geq C_2 \|u\|^p_b \quad \text{for all } u \in N_g. \] (4.4)

From (4.3) and (4.4) we conclude that
\[ \|u\|^p_b - \theta \int g(x, u) u \, d\Gamma \geq C_0 \|u\|^p_b \quad \text{for all } u \in X, \] (4.5)

where \( C_0 = \min\{C_1, C_2\} \).

The continuity of the embedding \( E \hookrightarrow L^q(\Omega; w_1) \) implies the existence of \( \bar{C} > 0 \) such that
\[ \bar{C} \|u\|^p_{q, \Omega, w_1} \leq \|u\|^p_b \quad \text{for all } u \in E. \]

By (4.1) and (4.5) we have
\[ C_0 \bar{C} \left( \int \Omega \|u\|^q w_1(x) \, dx \right)^{p/q} \leq C_0 \|u\|^p_b \leq \lambda \bar{C}_f \int \Omega \|u\|^q w_1(x) \, dx, \] (4.6)

which implies
\[ (\bar{C} C_0 \bar{C}_f^{-1} \lambda^{-1})^{q/(q-p)} \leq \int \Omega \|u\|^q w_1(x) \, dx. \]

This combined with (4.6) yields
\[ C_0 \bar{C} (\bar{C} C_0 \bar{C}_f^{-1} \lambda^{-1})^{p/(q-p)} \leq C_0 \|u\|^p_b. \] (4.7)

Using (4.7) together with (4.2) and (4.5) we obtain
\[ C_0 \bar{C} (\bar{C} C_0 \bar{C}_f^{-1} \lambda^{-1})^{p/(q-p)} \leq \frac{r - q}{r} (\bar{C}_f \lambda)^{r/(r-q)} \int \Omega \left( \frac{w_1}{h^q} \right)^{1/(r-q)} \, dx. \]

We see that our claim follows if we take
\[ \lambda^* = C^* \left( \int \Omega \left( \frac{w_1}{h^q} \right)^{1/(r-q)} \, dx \right)^{-(q-p)(r-q)/q(r-p)}, \]

where \( C^* \) denotes
\[ \bar{C}_f^{-1} \left[ C_0 \bar{C} \left( \frac{r}{r-q} \right)^{(q-p)/q} (r-q)/(r-p) \right]. \]

\( \square \)
Corollary 4.1. Suppose \( \theta_+ < \theta < \theta^* \) and \( \lambda > 0 \) such that \((P_{\lambda,\theta})\) has a solution \( u \). Then

\[
C_0 \|u\|_b^p + \frac{r-q}{r} \int_{\Omega} h|u|^r \, dx \leq \frac{r-q}{r} \left( \tilde{C}_f \lambda \right)^{r/(r-q)} \int_{\Omega} \left( \frac{w_1^r}{h^q} \right)^{1/(r-q)} \, dx
\]

and

\[
\|u\|_b \geq K \lambda^{-1/(q-p)},
\]

where \( K > 0 \) is a constant independent of \( u \).

**Proof.** The first part of the assertion follows by (4.2) and (4.5). The second one is implied by (4.7), which shows that the constant \( K \) can be chosen, for example, as \( \bar{C} q/p (\tilde{C} f - 1) r/(q-p) \).

\[\Box\]

5. Properties of \( \Phi_{\lambda,\theta} \)

Proceeding in the same manner as we did for proving (4.5), we can show that if we take \( \theta_- < \theta < \theta^+ \), then there exists \( c > 0 \) such that

\[
\frac{1}{p} \|u\|_b^p - \theta \int_{\Gamma} G(x,u) \, d\Gamma \geq c \|u\|_b^p \quad \text{for all } u \in X. \tag{5.1}
\]

We shall employ in what follows the following elementary inequality:

\[
s|u|^\mu - t|u|^\nu \leq C_{\mu,\nu} s \left( \frac{s}{t} \right)^{\nu/(\nu-\mu)} \quad \forall u \in \mathbb{R}, \forall s, t \in (0, \infty), \forall 0 < \mu < \nu. \tag{5.2}
\]

**Lemma 5.1.** Suppose \( \theta_- < \theta < \theta^+ \) and \( \lambda > 0 \) is arbitrary. Then the functional \( \Phi_{\lambda,\theta} \) is coercive.

**Proof.** From (3.4) we have that there exists \( C > 0 \) such that

\[
F(\lambda, x, u) \leq C \lambda |u|^q w_1(x) \quad \text{a.e. } x \in \Omega, \forall u \in \mathbb{R}. \tag{5.3}
\]

By virtue of (5.2) and \((H_{10})\) we obtain

\[
\int_{\Omega} \left( C \lambda w_1 |u|^q - \frac{h}{2r} |u|^r \right) \, dx \leq C_{r,q} \int_{\Omega} \lambda w_1 \left( \frac{w_1}{h} \right)^{q/(r-q)} \, dx
\]

\[
= C_{r,q} \lambda^{r/(r-q)} \int_{\Omega} \left( \frac{w_1^r}{h^q} \right)^{1/(r-q)} \, dx \leq C'.
\]

Using (5.1), (5.3) and the above estimate we find

\[
\Phi_{\lambda,\theta}(u) = \frac{1}{p} \|u\|_b^p - \theta \int_{\Gamma} G(x,u) \, d\Gamma - \int_{\Omega} F(\lambda, x, u) \, dx + \frac{1}{r} \int_{\Omega} h|u|^r \, dx
\]

\[
\geq c \|u\|_b^p - \int_{\Omega} \left( C \lambda |u|^q w_1 - \frac{h}{2r} |u|^r \right) \, dx + \frac{1}{2r} \int_{\Omega} h|u|^r \, dx
\]

\[
\geq c \|u\|_b^p + \frac{1}{2r} \int_{\Omega} h|u|^r \, dx - C'
\]

and the coercivity of \( \Phi_{\lambda,\theta} \) follows. \[\Box\]
Lemma 5.2. Suppose \( \theta_- < \theta < \theta^+ \), \( \lambda > 0 \) is arbitrary and \( \{u_n\} \) is a sequence in \( X \) such that \( \Phi_{\lambda, \theta}(u_n) \) is bounded. Then there exists a subsequence of \( \{u_n\} \), denoted again by \( \{u_n\} \), such that

\[
\int u_n \to u_0 \text{ in } X, \quad u_n \to u_0 \text{ a.e. in } \Omega \quad \text{and} \quad \Phi_{\lambda, \theta}(u_0) \leq \liminf_{n \to \infty} \Phi_{\lambda, \theta}(u_n).
\]

Proof. In view of Lemma 5.1, the boundedness of \( \Phi_{\lambda, \theta}(u_n) \) shows that \( \{u_n\} \) must be bounded in \( X \). Using (2.1) and Remark 1.2 we may assume (up to a subsequence) that

\[
u_n \to u_0 \text{ in } X, \quad u_n \to u_0 \text{ in } L^q(\Omega; w_1) \quad \text{and} \quad u_n \to u_0 \text{ a.e. in } \Omega.
\]

Set

\[\Xi(x, u) = F(\lambda, x, u) - \frac{1}{r}\lambda|u|^r \quad \text{and} \quad \xi(x, u) = \Xi_u(x, u).\]

By hypothesis (H\(_5\)) and (5.2) we obtain

\[
\xi_n(x, u) = f_n(\lambda, x, u) - (r - 1)\lambda|u|^{r-2} \leq \lambda c_f w_1|u|^{q-2} - (r - 1)\lambda|u|^{r-2} \leq C\lambda w_1 \left( \frac{\lambda w_1}{h} \right)^{2/(q-2)}.
\]

It follows that

\[
\int_{\Omega} (\Xi(x, u_n) - \Xi(x, u_0)) \, dx = \int_{\Omega} \left( \int_0^1 \left( \int_0^t \xi_n(x, u_0 + s(u_n - u_0)) \, ds \right) \, dt \right) (u_n - u_0)^2 \, dx 
\leq C' \int_{\Omega} \frac{w_1}{h^{(q-2)/(r-q)}} (u_n - u_0)^2 \, dx.
\]

This inequality will be used to get the estimate for \( \Phi_{\lambda, \theta}(u_0) - \Phi_{\lambda, \theta}(u_n) \):

\[
\Phi_{\lambda, \theta}(u_0) - \Phi_{\lambda, \theta}(u_n) = \frac{1}{p} (\|u_0\|^p - \|u_n\|^p) + \theta \int_{\Gamma} (G(x, u_n) - G(x, u_0)) \, d\Gamma 
\, + \int_{\Omega} (\Xi(x, u_n) - \Xi(x, u_0)) \, dx 
\leq \frac{1}{p} (\|u_0\|^p - \|u_n\|^p) + \theta \int_{\Gamma} (G(x, u_n) - G(x, u_0)) \, d\Gamma 
\, + C'' \int_{\Omega} \frac{w_1}{h^{(q-2)/(r-q)}} (u_n - u_0)^2 \, dx.
\]

The compactness of the trace operator \( E \to L^m(\Gamma; w_2) \) and the continuity of the Nemytskii operator \( N_\Gamma : L^m(\Gamma; w_2) \to L^1(\Gamma) \) imply that \( N_\Gamma(u_n) \to N_\Gamma(u_0) \) in \( L^1(\Gamma) \), i.e. \( \int_{\Gamma} |N_\Gamma(u_n) - N_\Gamma(u_0)| \, d\Gamma \to 0 \) as \( n \to \infty \). It follows that

\[
\lim_{n \to \infty} \int_{\Gamma} G(x, u_n) \, d\Gamma = \int_{\Gamma} G(x, u_0) \, d\Gamma. \quad (5.4)
\]
By Hölder’s inequality we find
\[ \int_{\Omega} \frac{w_1^{(r-2)/(r-q)}}{h_{(q-2)/(r-q)}} (u_n - u_0)^2 \, dx \leq \left( \int_{\Omega} \frac{w_1^{r}}{h^r} \, dx \right)^{(q-2)/q} \left( \int_{\Omega} |u_n - u_0|^q w_1(x) \, dx \right)^{2/q}. \]
Since \( u_n \to u_0 \) in \( L^q(\Omega; w_1) \) we obtain
\[ \lim_{n \to \infty} \int_{\Omega} \frac{w_1^{(r-2)/(r-q)}}{h_{(q-2)/(r-q)}} (u_n - u_0)^2 \, dx = 0. \] (5.5)
The lower semicontinuity of \( \| \cdot \|_b \) with respect to the weak topology, (5.4) and (5.5) finish the proof. \( \square \)

**Lemma 5.3.** Suppose \( \theta_* < \theta < \theta^* \) and \( \lambda_n \searrow \lambda_0 > 0 \) such that problem \( (P_{\lambda_n, \theta}) \) has a solution \( u_n \) for each \( n \). Then \( \{u_n\} \) converges weakly (up to a subsequence) in \( X \) to some \( u_0 \) which is a non-negative critical point of \( \Phi_{\lambda_0, \theta} \).

**Proof.** By Corollary 4.1, \( \{u_n\} \) is bounded in \( X \). Therefore, in view of Remark 1.2, Lemma 3.2 and (2.1), we may assume (passing eventually to subsequences) that
\[ u_n \to u_0 \text{ in } X, \quad u_n \to u_0 \text{ in } L^r(\Omega; h), \quad u_n \to u_0 \text{ in } E, \quad u_n \to u_0 \text{ in } L^p(\Gamma; b), \quad \frac{\partial u_n}{\partial x_i} \to \frac{\partial u_0}{\partial x_i} \text{ in } L^p(\Omega; a), \] (5.6)
\[ u_n \to u_0 \text{ in } L^q(\Omega; w_1), \quad u_n \to u_0 \text{ in } L^m(\Gamma; w_2), \]
\[ u_n \to u_0 \text{ a.e. in } \Omega, \quad u_n \to u_0 \text{ a.e. in } \Gamma. \] (5.7)
We now observe that the embedding \( E \to L^p_{\text{loc}}(\Omega) \) is compact for all \( p \leq s < p^* \). This and (5.6) imply
\[ u_n \to u_0 \text{ in } L^p_{\text{loc}}(\Omega), \quad \forall p \leq s < p^*. \] (5.8)
Since \( u_n \) is a non-negative critical point of \( \Phi_{\lambda_n, \theta} \) for each \( n \), we derive by (5.7) that \( u_0 \geq 0 \) in \( \Omega \) and for any \( v \in X \) we have
\[ \int_{\Omega} a |Du_n|^{p-2} Du_n \cdot Dv \, dx + \int_{\Gamma} b |u_n|^{p-2} u_n v \, d\Gamma + \int_{\Omega} h |u_n|^{r-2} u_n v \, dx = \int_{\Omega} f(\lambda_n, x, u_n) v \, dx + \theta \int_{\Gamma} g(x, u_n) v \, d\Gamma. \]
By (5.6) we find that \( \{|u_n|^{r-2} u_n\} \) is bounded in \( L^{r/(r-1)}(\Omega; h) \), while by (5.7) we have that \( |u_n|^{r-2} u_n \to |u_0|^{r-2} u_0 \) a.e. in \( \Omega \). Combining these facts we get
\[ |u_n|^{r-2} u_n \to |u_0|^{r-2} u_0 \text{ in } L^{r/(r-1)}(\Omega; h). \] (5.9)
For \( v \in L^r(\Omega; h) \) fixed, set \( l_v(u) = \int_{\Omega} h u v \, dx \), for all \( u \in L^{r/(r-1)}(\Omega; h) \). It is easy to verify that \( l_v \in (L^{r/(r-1)}(\Omega; h))' \). This together with (5.9) implies
\[ \lim_{n \to \infty} \int_{\Omega} h |u_n|^{r-2} u_n v \, dx = \int_{\Omega} h |u_0|^{r-2} u_0 v \, dx, \quad \forall v \in X. \] (5.10)
Similarly,
\[ \lim_{n \to \infty} \int_{\Gamma} b |u_n - u_0|^2 u_n v \, d\Gamma = \int_{\Gamma} b |u_0 - u_0|^2 u_0 v \, d\Gamma, \quad \forall v \in X. \]  
Taking into account (5.7) and Lemma 3.3 we infer that
\[ N_{f_{\lambda_0}}(u_n) \to N_{f_{\lambda_0}}(u_0) \text{ in } L^{q/(q-1)}(\Omega; w_1^{1/(1-q)}) \]  
and
\[ N_g(u_n) \to N_g(u_0) \text{ in } L^{m/(m-1)}(\Gamma; w_2^{1/(1-m)}). \]  
By Hölder’s inequality and (H7) we derive the estimates
\[
\int_{\Omega} |(f(\lambda_n, x, u_n) - f(\lambda_0, x, u_0))v| \, dx \\
\leq \int_{\Omega} |(f(\lambda_n, x, u_n) - f(\lambda_0, x, u_n))v| \, dx + \int_{\Omega} |(f(\lambda_0, x, u_n) - f(\lambda_0, x, u_0))v| \, dx \\
\leq C_f |\lambda_n - \lambda_0| \int_{\Omega} |u_n|^{q-1} |v| \, dx + \int_{\Omega} |(N_{f_{\lambda_0}}(u_n) - N_{f_{\lambda_0}}(u_0))v| \, dx \\
\leq C_f |\lambda_n - \lambda_0| \|u_n\|_{q, \Omega, w_1}^{q-1} \|v\|_{q, \Omega, w_1} + \|N_{f_{\lambda_0}}(u_n) - N_{f_{\lambda_0}}(u_0)\|_{q/(q-1), \Omega, w_1^{1/(1-q)}} \|v\|_{q, \Omega, w_1}
\]  
and
\[ \int_{\Gamma} |(g(x, u_n) - g(x, u_0))v| \, d\Gamma \leq \|N_g(u_n) - N_g(u_0)\|_{m/(m-1), \Gamma, w_2^{1/(1-m)}} \|v\|_{m, \Gamma, w_2}. \]  
Then, in virtue of (5.12) we find
\[
\begin{align*}
\lim_{n \to \infty} \int_{\Omega} f(\lambda_n, x, u_n) v \, dx &= \int_{\Omega} f(\lambda_0, x, u_0) v \, dx, \quad \forall v \in X, \\
\lim_{n \to \infty} \int_{\Gamma} g(x, u_n) v \, d\Gamma &= \int_{\Gamma} g(x, u_0) v \, d\Gamma, \quad \forall v \in X.
\end{align*}
\]  
We now claim that $Du_n \to Du_0$ a.e. in $\Omega$. Set
\[ \Omega_R = \left\{ x \in \mathbb{R}^N : |x| < R \text{ and } \text{dist}(x, \mathbb{R}^N \setminus \Omega) > \frac{1}{R} \right\}. \]  
It is clear that there exists $R_0 > 0$ such that $\Omega_R \neq \emptyset$ for all $R > R_0$. Since $\Omega_R \subset \Omega_{R'} \subset \subset \Omega$ for all $R_0 \leq R < R'$ and $\bigcup_{R \geq R_0} \Omega_R = \Omega$ we need only to show
\[ Du_n \to Du_0 \text{ a.e. in } \Omega_R \text{ for any } R \geq R_0. \]
By H"older’s inequality, (5.6) and (5.8) we derive
\[
|\xi - \zeta|^p \leq C(|\xi|^{p-2} \xi - |\zeta|^{p-2} \zeta)(\xi - \zeta), \quad \text{for } p \geq 2; \quad (5.15)
\]
\[
|\xi - \zeta|^2 \leq C(|\xi|^{p-2} \xi - |\zeta|^{p-2} \zeta)(\xi - \zeta)(|\xi| + |\zeta|)^{2-p}, \quad \text{for } 1 < p < 2. \quad (5.16)
\]
Therefore, it is sufficient to prove that
\[
(|Du_n|^{p-2} Du_n - |Du_0|^{p-2} Du_0) \cdot (Du_n - Du_0) \to 0 \quad \text{a.e. in } \Omega_R \text{ for any } R \geq R_0. \quad (5.17)
\]
For a fixed $R \geq R_0$, choose $\vartheta \in C_0^\infty(\mathbb{R}^N)$ with $0 \leq \vartheta \leq 1$ in $\mathbb{R}^N$, $\vartheta \equiv 1$ on $\Omega_R$ and $\vartheta \equiv 0$ on $\mathbb{R}^N \setminus \Omega_{2R}$. Then by (5.6) and (5.7) we have that $\vartheta u_n \to \vartheta u_0$ in $E$ which yields
\[
\int_\Omega a|Du_0|^{p-2} Du_0 \cdot D(\vartheta u_n - \vartheta u_0) \, dx + \int_\Gamma b\vartheta|u_0|^{p-2} u_0(u_n - u_0) \, d\Gamma \to 0. \quad (5.18)
\]
By H"older’s inequality and (5.8) we find
\[
\left| \int_\Omega a(u_n - u_0)|Du_0|^{p-2} Du_0 \cdot D\vartheta \, dx \right| \leq C_1 \left( \int_{\text{supp } \vartheta} a|Du_0|^p \, dx \right)^{(p-1)/p} \left( \int_{\text{supp } \vartheta} |u_n - u_0|^p \, dx \right)^{1/p} \to 0.
\]
Using this fact in (5.18) we obtain
\[
\int_\Omega a\vartheta|Du_0|^{p-2} Du_0 \cdot D(u_n - u_0) \, dx + \int_\Gamma b\vartheta|u_0|^{p-2} u_0(u_n - u_0) \, d\Gamma \to 0. \quad (5.19)
\]
On the other hand, since $\langle \Phi_{\lambda_n, \vartheta}(u_n), \vartheta(u_n - u_0) \rangle = 0$ we have
\[
\int_\Omega a\vartheta|Du_n|^{p-2} Du_n \cdot D(u_n - u_0) \, dx + \int_\Gamma b\vartheta|u_n|^{p-2} u_n(u_n - u_0) \, d\Gamma
\]
\[
+ \int_{\Omega} a(u_n - u_0)|Du_n|^{p-2} Du_n \cdot D\vartheta \, dx = \int_\Omega h\vartheta|u_n|^{r-2} u_n(u_0 - u_n) \, dx
\]
\[
+ \int_\Omega f(\lambda_n, x, u_n)\vartheta(u_n - u_0) \, dx + \int_\Gamma g(x, u_n)\vartheta(u_n - u_0) \, d\Gamma.
\]
By H"older’s inequality, (5.6) and (5.8) we derive
\[
\left| \int_\Omega a(u_n - u_0)|Du_n|^{p-2} Du_n \cdot D\vartheta \, dx \right| \leq C_1 \left( \int_{\text{supp } \vartheta} a|Du_n|^p \, dx \right)^{(p-1)/p} \left( \int_{\text{supp } \vartheta} |u_n - u_0|^p \, dx \right)^{1/p} \to 0
\]
and
\[
\left| \int_\Omega h\vartheta|u_n|^{r-2} u_n(u_0 - u_n) \, dx \right| \leq C_2 \left( \int_{\text{supp } \vartheta} h|u_n|^r \, dx \right)^{(r-1)/r} \left( \int_{\text{supp } \vartheta} |u_n - u_0|^r \, dx \right)^{1/r} \to 0.
\]
By (3.4), (5.7), (5.12) and Hölder’s inequality we see that
\[
\left| \int_\Omega f(\lambda_n, x, u_n)\partial(u_n - u_0)\,dx \right| \leq \tilde{C}_f \sup_{n \geq 1} \lambda_n \int_\Omega |u_n|^q - 1 |u_n - u_0| w_1\,dx \\
\leq \tilde{C}_f \sup_{n \geq 1} \lambda_n \|u_n\|_{q, \Omega, w_1} \|u_n - u_0\|_{q, \Omega, w_1} \to 0
\]
and
\[
\left| \int_\Gamma g(x, u_n)\partial(u_n - u_0)\,d\Gamma \right| \leq \|N_g(u_n)\|_{m/(m-1), \Gamma, w_{1/(1-m)}^2} \|u_n - u_0\|_{m, \Gamma, w_2} \to 0.
\]
It follows that
\[
\int_\Omega a \partial |Du_n|^{p-2} Du_n \cdot D(u_n - u_0)\,dx + \int_\Gamma b \partial |u_n|^{p-2} u_n(u_n - u_0)\,d\Gamma \to 0. \tag{5.20}
\]
Since
\[
0 \leq \int_\Omega a \partial (|Du_n|^{p-2} - |Du_0|^{p-2}) \cdot (Du_n - Du_0)\,dx \\
\leq \int_\Omega a \partial (|Du_n|^{p-2} - |Du_0|^{p-2}) \cdot (Du_n - Du_0)\,dx \\
+ \int_\Gamma b \partial (|u_n|^{p-2} - |u_0|^{p-2}) u_n(u_n - u_0)\,d\Gamma
\]
we deduce by (5.19) and (5.20) that
\[
\lim_{n \to \infty} \int_{\Omega_R} a (|Du_n|^{p-2} - |Du_0|^{p-2}) \cdot (Du_n - Du_0)\,dx = 0.
\]
Hence (5.17) holds. Therefore, the claim that $Du_n \to Du_0$ a.e. in $\Omega$ is proved. This combined with the fact that $\{|Du_n|^{p-2}\partial u_n/\partial x_i\}$ is bounded in $L^{p/(p-1)}(\Omega; a)$ implies
\[
|Du_n|^{p-2} \frac{\partial u_n}{\partial x_i} \to |Du_0|^{p-2} \frac{\partial u_0}{\partial x_i} \text{ in } L^{p/(p-1)}(\Omega; a).
\]
It follows that
\[
\lim_{n \to \infty} \int_\Omega a |Du_n|^{p-2} Du_n \cdot Dv\,dx = \int_\Omega a |Du_0|^{p-2} Du_0 \cdot Dv\,dx, \quad \forall v \in X. \tag{5.21}
\]
By (5.10), (5.11), (5.14) and (5.21) we conclude that $u_0$ is a critical point of $\Phi_{\lambda, 0}$. □

6. Proof of Theorem 2.3

Let $\theta \in J$ and $\lambda > 0$ be arbitrary. From Lemma 5.1 we see that $m_{\lambda, \theta} := \inf_{u \in X} \Phi_{\lambda, \theta}(u)$ is real. Let $\{u_n\}$ be a sequence such that $u_{n} \to u_0$ and $\Phi_{\lambda, \theta}(u_0) = m_{\lambda, \theta}$. According to Lemma 5.2, we can assume (up to a subsequence) that
\[
u_n \to u_0 \text{ in } X \quad \text{and} \quad \Phi_{\lambda, \theta}(u_0) \leq \liminf_{n \to \infty} \Phi_{\lambda, \theta}(u_n) = m_{\lambda, \theta}.
\]
By virtue of (5.1) and (6.2) we have \( \Phi \) where
\[
G(x,|u_0|) \geq G(x,u_0) \quad \text{a.e. } x \in \Omega \quad \text{and} \quad F(\lambda,x,|u_0|) \geq F(\lambda,x,u_0) \quad \text{a.e. } x \in \Omega.
\]
It follows that \( \Phi_{\lambda,\theta}(|u_0|) \leq \Phi_{\lambda,\theta}(u_0) \). Therefore, we may assume that \( u_0 \geq 0 \) on \( \Omega \). To ensure that \( u_0 \neq 0 \) we shall prove that \( m_{\lambda,\theta} \) is negative provided that \( \lambda > \lambda \) for some \( \lambda > 0 \).

By hypothesis (H_6) we deduce that there exists \( \delta > 0 \) independent of \( x \) and \( \lambda \) such that
\[
F(\lambda,x,u(x)) \geq \frac{\lambda}{2q} |u(x)|^q w_1(x) \quad \text{a.e. } x \in \Omega, \forall u \in X \text{ with } \sup_{x \in \Omega} |u(x)| \leq \delta. \quad (6.1)
\]

Set \( \zeta > 0 \) with the property that
\[
Y = \left\{ u \in X \setminus \{0\} : \sup_{x \in \Omega} |u(x)| \leq \zeta \|u\|_{q,\Omega,w_1} \right\} \neq \emptyset
\]
and denote \( \eta = (\delta / \zeta)^{\theta} \). Define
\[
\lambda := \inf \left\{ \frac{2q}{\eta^p} \|u\|^p_b - \frac{2q}{\eta} \theta \int_{\Gamma} G(x,u) \, d\Gamma + \frac{2q}{\eta^r} \int_{\Omega} h|x|^r \, dx : u \in Z \right\},
\]
where
\[
Z = \left\{ u \in X : \sup_{x \in \Omega} |u(x)| \leq \delta, \int_{\Omega} |u|^q w_1(x) \, dx = \eta \right\}.
\]
It is easy to verify that \( Z \neq \emptyset \). Indeed, if \( y \in Y \), then
\[
u = \frac{\eta^{1/q}}{\|y\|_{q,\Omega,w_1}} y \in Z.
\]

We now claim that \( \lambda > 0 \). For this aim, we consider the constrained minimization problem,
\[
M := \inf \left\{ \|u\|^p_b : u \in E, \int_{\Omega} |u|^q w_1(x) \, dx = \eta \right\}.
\]
Since the embedding \( E \rightarrow L^q(\Omega;w_1) \) is continuous, it follows that \( M > 0 \). Thus
\[
\|u\|^p_b \geq M \quad \text{for all } u \in X \text{ with } \int_{\Omega} |u|^q w_1(x) \, dx = \eta.
\]

By applying the Hölder inequality we find
\[
\int_{\Omega} |u|^q w_1 \, dx = \int_{\Omega} \frac{w_1}{h^{q/r}} h^{q/r} |u|^q \, dx \leq \left( \int_{\Omega} \left( \frac{w_1}{h^{q/r}} \right)^{1/(r-q)} \, dx \right)^{(r-q)/r} \cdot \left( \int_{\Omega} h|x|^r \, dx \right)^{q/r}.
\]

By virtue of (5.1) and (6.2) we have
\[
\frac{2q}{\eta^p} \|u\|^p_b - \frac{2q}{\eta} \theta \int_{\Gamma} G(x,u) \, d\Gamma + \frac{2q}{\eta^r} \int_{\Omega} h|x|^r \, dx \geq \frac{2q}{c} \|u\|^p_b + \frac{2q}{\eta^r} \int_{\Omega} h|x|^r \, dx
\]
\[
\geq \frac{2q}{\eta} cM + \frac{2q}{\eta^r} \eta^{r/q} \left( \int_{\Omega} \left( \frac{w_1}{h^{q/r}} \right)^{1/(r-q)} \, dx \right)^{-(r-q)/q}
\]
for all \( u \in X \) with \( \int_\Omega |u|^q w_1 \, dx = \eta \). It follows that

\[
\bar{\lambda} \geq 2q_\eta cM + 2q_\eta \langle r-q \rangle / q \left( \int_\Omega \left( \frac{u_1^{r-q}}{h_1} \right)^{1/(r-q)} \, dx \right)^{(r-q)/q}
\]

and our claim follows.

Let \( \lambda > \bar{\lambda} \). Then there exists a function \( u_1 \in Z \) such that

\[
\lambda > \frac{2q_\eta}{\eta p} \|u_1\|_p^p - \frac{2q_\eta}{\eta r} \int_\Omega G(x, u_1) \, d\Gamma + \frac{2q_\eta}{\eta r} \int_\Omega h|u_1|^r \, dx.
\]

This inequality and (6.1) imply

\[
\Phi_{\lambda, \theta}(u_1) = \frac{1}{p} \|u_1\|_p^p - \theta \int_\Omega G(x, u_1) \, d\Gamma + \frac{1}{r} \int_\Omega h|u_1|^r \, dx - \int_\Omega F(\lambda, x, u_1(x)) \, dx
\]

\[
\leq \frac{1}{p} \|u_1\|_p^p - \theta \int_\Omega G(x, u_1) \, d\Gamma + \frac{1}{r} \int_\Omega h|u_1|^r \, dx - \frac{\lambda}{2q_\eta} \int_\Omega |u_1|^q w_1 \, dx < 0.
\]

Consequently, \( \inf_{u \in X} \Phi_{\lambda, \theta}(u) < 0 \). Thus, the problem \( (P_{\lambda, \theta}) \) has a solution if \( \theta \in J \) and \( \lambda > \bar{\lambda} \). Set

\[
\lambda_0 = \inf \{ \lambda > 0 : (P_{\lambda, \theta}) \text{ admits a solution} \}.
\]

By Theorem 2.2, we see that \( \lambda_0 \geq \lambda^* > 0 \).

We now show that for each \( \lambda > \lambda_0 \) problem \( (P_{\lambda, \theta}) \) admits a solution. Indeed, for every \( \lambda > \lambda_0 \) there exists \( \rho \in (\lambda_0, \lambda) \) such that problem \( (P_{\rho, \theta}) \) has a solution \( u_\rho \) which is a subsolution of problem \( (P_{\lambda, \theta}) \). We consider the variational problem,

\[
\inf \{ \Phi_{\lambda, \theta}(u) : u \in X \text{ and } u \geq u_\rho \}.
\]

By Lemmas 5.1 and 5.2 this problem admits a solution \( \bar{u} \). This minimizer \( \bar{u} \) is a solution of problem \( (P_{\lambda, \theta}) \). It remains to show that problem \( (P_{\lambda_0, \theta}) \) also has a solution. Let \( \lambda_n \rightarrow \lambda_0 \) and \( \lambda_n > \lambda_0 \) for each \( n \). Problem \( (P_{\lambda_n, \theta}) \) has a solution \( u_n \) for each \( n \). Then, in virtue of Lemma 5.3, we may assume (up to a subsequence) that \( u_n \rightarrow u_0 \) in \( X \), \( u_n \rightarrow u_0 \) in \( L^q(\Omega; w_1) \), \( u_n \rightarrow u_0 \) in \( L^m(\Gamma; w_2) \), where \( u_0 \) is a non-negative critical point of \( \Phi_{\lambda_0, \theta} \). To conclude that \( u_0 \) is a solution of problem \( (P_{\lambda_0, \theta}) \) it remains only to prove that \( u_0 \neq 0 \). Since \( u_n \) and \( u_0 \) are critical points of \( \Phi_{\lambda_n, \theta} \) and \( \Phi_{\lambda_0, \theta} \), respectively, we have

\[
\langle I'(u_n), u_n - u_0 \rangle - \langle I'(u_0), u_n - u_0 \rangle + \langle J'(u_n), u_n - u_0 \rangle - \langle J'(u_0), u_n - u_0 \rangle = J_{1,n} + J_{2,n},
\]

where

\[
J_{1,n} = \int_\Omega (f(\lambda_n, x, u_n) - f(\lambda_0, x, u_0))(u_n - u_0) \, dx,
\]

\[
J_{2,n} = \theta \int_\Gamma (g(x, u_n) - g(x, u_0))(u_n - u_0) \, d\Gamma.
\]
It is easy to see that
\[ 0 \leq \langle \mathcal{I}'(u_n), u_n - u_0 \rangle - \langle \mathcal{I}'(u_0), u_n - u_0 \rangle \leq J_{1,n} + J_{2,n}. \tag{6.3} \]

Using (3.4) we get the estimate
\[ |J_{1,n}| \leq \tilde{C}_f \left( \lambda_n \int_{\Omega} |u_n|^{q-1} |u_n - u_0| w_1(x) \, dx + \lambda_0 \int_{\Omega} |u_0|^{q-1} |u_n - u_0| w_1(x) \, dx \right) \]
and it follows from the Hölder inequality that
\[ |J_{1,n}| \leq \tilde{C}_f \left( \sup_{n \geq 1} \lambda_n ||u_n||_{q,\Omega,w_1}^{q-1} + \lambda_0 ||u_0||_{q,\Omega,w_1}^{q-1} \right) ||u_n - u_0||_{q,\Omega,w_1} \to 0. \tag{6.4} \]

By (5.12) and Hölder’s inequality we find
\[ |J_{2,n}| \leq |\theta||N_g(u_n) - N_g(u_0)||_{m/(m-1),\Gamma,w_1^{1/(1-m)}} ||u_n - u_0||_{m,\Gamma,w_2} \to 0. \tag{6.5} \]

Relations (6.3), (6.4) and (6.5) yield
\[ \langle \mathcal{I}'(u_n), u_n - u_0 \rangle - \langle \mathcal{I}'(u_0), u_n - u_0 \rangle \to 0 \quad \text{as} \ n \to \infty. \]

We show that \( ||u_n - u_0||_{b} \to 0 \) as \( n \to \infty \). We distinguish two cases which may occur.

**Case 1.** \( p \geq 2 \). Using (5.15) we obtain
\[ ||u_n - u_0||_{b}^p \leq C(||\mathcal{I}'(u_n), u_n - u_0|| - ||\mathcal{I}'(u_0), u_n - u_0||) \to 0 \quad \text{as} \ n \to \infty, \]
which shows that \( ||u_n||_{b} \to ||u_0||_{b} \) as \( n \to \infty \).

**Case 2.** \( 1 < p < 2 \). We observe that it is enough to show that
\[ ||u_n - u_0||_{b}^2 \leq C(||\mathcal{I}'(u_n), u_n - u_0|| - ||\mathcal{I}'(u_0), u_n - u_0||)(||u_n||_{b}^{2-p} + ||u_0||_{b}^{2-p}). \tag{6.6} \]

In order to prove (6.6) we recall the following result: for all \( s > 0 \) there is a constant \( C_s > 0 \) such that
\[ (x + y)^s \leq C_s (x^s + y^s) \quad \text{for any} \ x, y \in (0, \infty). \tag{6.7} \]

Then we obtain
\[ ||u_n - u_0||_{b}^2 = \left( \int_{\Omega} a(x)|Du_n - Du_0|^p \, dx + \int_{\Gamma} b(x)|u_n - u_0|^p \, d\Gamma \right)^{2/p} \leq C_p \left[ \left( \int_{\Omega} a(x)|Du_n - Du_0|^p \, dx \right)^{2/p} + \left( \int_{\Gamma} b(x)|u_n - u_0|^p \, d\Gamma \right)^{2/p} \right]. \tag{6.8} \]
In a similar way we can obtain the estimate, it is now easy to observe that inequalities (6.8), (6.9) and (6.10) imply the estimate (6.6).

Using (5.16), (6.7) and the Hölder inequality we find

\[
\int_{\Omega} a(x)|D u_n - D u_0|^p \, dx
\]

\[
= \int_{\Omega} a(x)(|D u_n - D u_0|^2)^{p/2} \, dx
\]

\[
\leq c_1 \left( \int_{\Omega} a(|D u_n|^{p-2} D u_n - |D u_0|^{p-2} D u_0) \cdot (D u_n - D u_0) \, dx \right)^{p/2}
\]

\[
\times \left( \int_{\Omega} (a(|D u_n| + |D u_0|)^{p}(2-p)/2 \, dx \right)^{2-p)/2}
\]

\[
\leq c_2 \left( \int_{\Omega} a(|D u_n|^{p-2} D u_n - |D u_0|^{p-2} D u_0) (D u_n - D u_0) \, dx \right)^{p/2}
\]

\[
\times \left( \int_{\Omega} (a|D u_n|^p + a|D u_0|^p) \, dx \right)^{(2-p)/2}
\]

\[
\leq c_3 \left( \int_{\Omega} a(x)(|D u_n|^{p-2} D u_n - |D u_0|^{p-2} D u_0) \cdot (D u_n - D u_0) \, dx \right)^{p/2}
\]

\[
\times (\|u_n\|_b^p + \|u_0\|_b^p)^{(2-p)/2}
\]

\[
\leq c_4 \left( \int_{\Omega} a(x)(|D u_n|^{p-2} D u_n - |D u_0|^{p-2} D u_0) \cdot (D u_n - D u_0) \, dx \right)^{p/2}
\]

\[
\times (\|u_n\|_b^{(2-p)p/2} + \|u_0\|_b^{(2-p)p/2}).
\]

Using the last inequality and (6.7) we have the estimate,

\[
\left( \int_{\Omega} a(x)|D u_n - D u_0|^p \, dx \right)^{2/p}
\]

\[
\leq c_p(\langle I'(u_n), u_n - u_0 \rangle - \langle I'(u_0), u_n - u_0 \rangle)(\|u_n\|_b^{2-p} + \|u_0\|_b^{2-p}). \quad (6.9)
\]

In a similar way we can obtain the estimate,

\[
\left( \int_{\Gamma} b(x)|u_n - u_0|^p \, d\Gamma \right)^{2/p}
\]

\[
\leq c'_p(\langle I'(u_n), u_n - u_0 \rangle - \langle I'(u_0), u_n - u_0 \rangle)(\|u_n\|_b^{2-p} + \|u_0\|_b^{2-p}). \quad (6.10)
\]

It is now easy to observe that inequalities (6.8), (6.9) and (6.10) imply the estimate (6.6).

In both cases, by Corollary 4.1, \(u_0 \neq 0\). This concludes our proof. \(\square\)
